For an additional fee, we can come to your home or workplace to collect specimens.

Innovation and Technology

Conveniently Located

www.labbiomedic.com

Medical Analyses

We offer a complete range of medical analyses in the following specialties:

- > Hematology
- > Biochemistry
- > Microbiology
- > Serology
- > Immunology
- > Cytopathology

Electrocardiograms

Electrocardiograms may be performed in our office or at the workplace. The results are immediate and cardiologist approval is obtained within 24 hours.

ThinPrep PAP Test

The ThinPrep Pap Test analysis is a technology exclusively offered in private clinics. Worldwide studies have shown that the ThinPrep Pap Test is more precise than the conventional Pap smear.

Although the cells are collected in the same manner as a conventional Pap smear, the ThinPrep technique produces a superior quality slide for diagnostic analysis.

We now perform the Gynecologic sampling at our Quebec laboratory facilities for the Thinprep Pap test and HPV analysis. Call us for an appointment.

VPH (Virus du Papillome Humain)

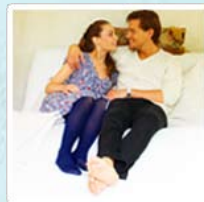

HPV includes over 100 strains of viruses spread by skin contact. While most strains of HPV go away on their own, some high-risk strains of HPV can cause cervical cancer. A Pap smear, and an HPV test when recommended,

is the best way to detect cervical cancer.

We now perform the Gynecologic sampling at our Quebec laboratory facilities for the Thinprep Pap test and HPV analysis. Call us for an appointment.

STD screening

We perform screening of Sexual Transmitted Diseases.

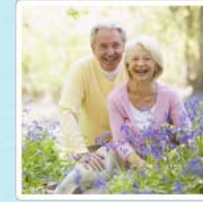

- > HIV
- > Syphilis (VDRL)
- > Herpes 1 and 2
- > Chlamydia by PCR from urine
- > Gonorrhea by PCR from urine
- > Hepatitis B and C
- HPV (Human Papilloma Virus)

Bladder and Urethra Cancer Screening

This is a new, safe and effective method for screening bladder and urethra cancer through urine testing. The immunohistofluorescence (uCyt⁺) allows for outstanding detection and diagnosis. Therefore, it offers an excellent follow-up for the treatment of this disease.

Respiratory Allergies IgE

Through a simple blood test, we are now able to accurately detect from the one or many elements to which an individual has developed an allergy. We use the ImmunoCAP technology

from Phadia to make the analyses.

Ex.: animal fur, tree pollen, grass pollen, weeds, dust, mites.

Food Allergies IgE

A food allergy is characterized by unusually intense defence reactions following ingestion of food deemed harmful by the human body. Indeed, the system reacts very strongly to allergen involved by setting

off a series of defence mechanisms.

Ex.: tree nuts and peanuts, dairy products, fish and seafood, fruits and vegetables.

Food Intolerance IgG

Food intolerance is completely different from allergies.

It occurs very frequently and develops throughout the life of an individual and often spontaneously. Symptoms of food intolerance may

resemble those of an allergy and often appear hours or even days after eating the food.
